

Mobile Technology CAN Improve Critical Care

When a child is in surgery or in the pediatric intensive care unit (PICU) every moment is critical and decisions are made quickly.

That's why cutting-edge technology, like a **mobile CT system**, is vital to help Gillette Children's Specialty Healthcare surgeons and doctors.

A child undergoing surgery or recovering in the PICU might need advanced imaging immediately. Instead of taking that child through the hallways and down an elevator—we can bring the imaging system to the child.

At Gillette, the mobile CT system is a key part of our critical care plan. It saves time and improves safety for children who have complex conditions, rare disorders and traumatic injuries.

New technology CAN make a difference to a child in critical care.

Thanks to a generous challenge match from the Richard M. Schulze Family Foundation, the proceeds from tonight's Fund-A-Need will be matched to help us purchase the mobile CT system.

A mobile CT system will help Gillette patients.
